So that's what they defined as an ultraconserved element. And it simply has-- So it's going to go to up to infinity. Please review your cart. Those elements that are responsible for similarities between different species should be conserved through time stabilizing selection while those elements responsible for differences among species should be divergent positive selection. All the cells-- most of the cells actually died. Genome assembly quality validation criteria are described in details in []. Orthologous pairs usually have the same or similar function, which is not necessarily the case for collateral pairs.
