The most dangerous form of heart racing is ventricular fibrillation in which the ventricles quiver rather than contract, and which if untreated is rapidly fatal. Blockage of any of these arteries could result in a myocardial infarction. The Joy of Cooking. Physiology of Elasmobranch Fishes. Retrieved 14 August The heart in arthropods is typically a muscular tube that runs the length of the body, under the back and from the base of the head.

Small lymphatic networks called plexuses exist beneath each of the three layers. The right atrium is connected to the right ventricle by the tricuspid valve. The Nervous System at the Cellular
